Abstract: Here we raise several questions concerning linear spaces of matrices with fixed rank over $\mathbb{F}_q$.

AMS Subject Classification: 15A30, 12E20, 14N05
Key Words: linear spaces of matrices, rank, Hermitian matrices over a finite field

*

Here we raise the following questions.

Question 1. Fix integers $m \geq n \geq k > 0$, $e \geq 1$, and a prime power q. What is the maximal integer $a(q, m, n, k)$, (resp. $b(q, m, n, k)$) such that there is an $a(q, m, n, k)$-dimensional (resp. $d(q, m, n, k)$-dimensional $\mathbb{F}_q$-vector space of $n \times m$ matrices over $\mathbb{F}_q$ such that each non-zero element of it has rank k (resp. $\leq k$)? What is the maximal integer $a(q, m, n, k, e)$, (resp. $b(q, m, n, k)$) such that there is an $a(q, m, n, k, e)$-dimensional (resp. $b(q, m, n, k, e)$-dimensional) $\mathbb{F}_{q^e}$-vector space of $n \times m$ matrices with a basis defined over $\mathbb{F}_q$ such that each non-zero element of it has rank k (resp. $\leq k$)? Say something about the linear subspaces with maximal dimension.

Question 2. Fix integers $n \geq k > 0$, $e \geq 1$, and a prime power q. What is the maximal integer $c(q, n, k)$, (resp. $d(q, n, k)$) such that there is a $c(q, n, k)$-dimensional (resp. $d(c, q, n, k)$-dimensional) $\mathbb{F}_q$-vector space of symmetric $n \times n$

matrices over $\mathbb{F}_q$ such that each non-zero element of it has rank k (resp. $\leq k$)? What is the maximal integer $c(q,n,k,e)$, (resp. $d(q,m,n,k)$) such that there is an $a(q,m,m,k,e)$-dimensional $\mathbb{F}_{q^e}$-vector space of $n\times m$ matrices with a basis defined over $\mathbb{F}_q$ such that each non-zero element of it has rank k (resp. $\leq k$)? Say something about the linear subspaces with maximal dimension.

Question 3. Fix integers $n \geq k > 0$ and a prime power q. What is the maximal integer $e(q,n,k)$ (resp. $f(q,n,k)$) such that there is an $e(q,n,k)$-dimensional (resp. $f(q,n,k)$-dimensional) $\mathbb{F}_q$-linear spaces of Hermitian matrices over $\mathbb{F}_{q^2}$ such that each non-zero element of it has rank k (resp. $\leq k$)?

Question 4. Fix integers $m \geq n \geq k\ t > 0$ and a prime power q such that $0 < t < a(q,m,n,k)$. Show the existence of a t-dimensional $\mathbb{F}_q$-vector space of $n\times m$ matrices over $\mathbb{F}_q$ such that each non-zero element of it has rank k, but that it is not contained in a bigger linear space with the same property. Hopefully, prove the same guess for the other integers introduced in Questions 1, 2 and 3.

For backgroud on Hermitian matrices over a finite field, see [6], Chapter 23; however, here we use the notation $\mathbb{F}_q$ (resp. $\mathbb{F}_{q^2}$) instead of $\mathbb{F}_{\sqrt{q}}$) resp. $\mathbb{F}_q$. For similar problems for the real, complex and quaternionic division rings, see [1], [2], [3], [4], [5] and [7].

Question 5. Fix as the base field F either the real or the complex or the quaternionic division ring. Take the set-up of Questions 1 or 2 for $e = 1$. Is there a maximal dimension linear subspace defined over the rational field?

Remark 1. Fix as the base field F either the real or the complex or the quaternionic division ring. Take the case $m = n$ and $k = n-1$. The existence parts of the proofs in [1], [2] and [3] use an induction on n in which all the 3 division rings play simultaneously. In this way we get at least ain terms of n an explicit upper bound for the degree of the extension L of $\mathbb{Q}$ on which a maximal dimension linear subspace may be defined over L.

Remark 2. Take the case $k = n$. Let $A, A_1, \dots, A_t$ be $n\times m$ matrices over $\mathbb{F}_q$. $\mathrm{rank}(A) < n$ if and only if $m-n+1$ $n\times n$ submatrices of A have zero-determinant. Hence the set $B(A_1,\dots,A_t$ = of all $(x_1,\dots,x_t) \in {\mathbb{F}_{q^e}}^{\oplus t}$ such nthat $\mathrm{rank}(x_1A_1+\dots+x_tA_t) < n$ is defined by $m-n+1$ homogeneous degree n equations with coefficients in $\mathbb{F}_q$. By Chevalley-Warning Theorem for systems of homogeneous equations we get $a(q,m,n,n) \leq n(m-n+1)$. The same theorem gives an upper bound for the integer $a(q,m,n,k)$ for any $k < n$. However, these upper bounds do not use the structure of the determinantal equations and hence they probably are very bad.
